## Overview

Smart Fan and Power Expansion Board

## Features

1. Width voltage input: 6V~14V With power switch

2. Output: DC 5V 4A with two channel outputs:

OUT1 for external device such as servo, motor, robots, mechanical arm. Max current is 2A, and can be programming control to on/off; please note OUT2 (GPIO output for raspberry pi);Max current is up to 4A if the OUT2 CAN'T be programming control, it will be output to raspberry pi directly.

3. Built-in temperature sensor, with active cooling fan, you can control flexibly the ON/OFF of mini fan via I2C command and GPIO programming. please refer to SAMPLE CODE 2;

4. Support hardware pwm to control fan, please refer to SAMPLE CODE 3;

Temperature range and accuracy

- -25 °C ~ + 100 °C when the ± 2 °C
- -55 °C ~ +125 °C when the ± 3 °C

5. Cooling Fan can be replaced, please refer to FAN SPECIFICATIONS;

6. Standard HAT size;

Raspberry Pi Smart Fan and Power Expansion Board  
sku:464657

# Packing List

- 1 x Board;
- 1 x Mini fan (with install screws)

## SAMPLE CODE 1

```
#demonstrates how to control the output of OUT1
import RPi.GPIO as GPIO
import time

GPIO_PIN = 27

GPIO.setmode(GPIO.BCM)
GPIO.setup(GPIO_PIN, GPIO.OUT)
GPIO.setwarnings(False)
while True:
    #turn on the power output, LED is on
    GPIO.output(GPIO_PIN,GPIO.HIGH)
    print "Turn on the power output"
    time.sleep(10)
    #turn off the power output, LED is off
    GPIO.output(GPIO_PIN,GPIO.LOW)
    print "Turn off the power output"
    time.sleep(10)
```

Download it: File:Out1-onoff.zip

or

```
wget http:// raspberrypiwiki.com/download/battery-fan-board/out1-onoff
```

Raspberry Pi Smart Fan and Power Expansion Board  
sku:464657

Run this sample code, if you can found the out1 led turns on, after 10 seconds, out1 led turns off, in turn.

## SAMPLE CODE 2

```
